Huge Mineral Resource increase ranks Springdale second largest graphite deposit in Australia

HIGHLIGHTS

- Total Springdale Mineral Resource estimate grows from 15.3Mt @ 6.0% Total Graphitic Carbon (TGC) to **49.3Mt @ 6.5% TGC¹**:
 - Indicated category – **11.5Mt @ 7.5% TGC**
 - Inferred category – **37.8Mt @ 6.1% TGC**
- At 5% TGC cut-off, Mineral Resource estimate is **28.0Mt @ 8.7% TGC**:
 - Indicated category – **7.9Mt @ 9.3% TGC**
 - Inferred category – **20.1Mt @ 8.5% TGC**
- Only ~10% of tenement area explored and ~20% of exploration targets tested to date
- 27% of Mineral Resource classified as Indicated – sufficient for long term mine planning
- More than 10% contributed by new graphite discovery at Mason Bay – 2km east of the original Springdale Mineral Resource
- Fine flake mineralisation – ideally suited for battery anode materials and the lithium-ion battery market

The second largest known graphite deposit in Australia has been revealed at International Graphite's (ASX:IG6) Springdale Graphite Project, in Western Australia, following the release of a new Mineral Resource estimate today.

The independent estimate is 3.4 times the previous estimate as shown in Table 1.

International Graphite Chairman Phil Hearse said the results from an extensive drilling campaign in 2022/23 had surpassed all expectations.

"Not only have we significantly increased the size of the Mineral Resource, 27% of it (by contained graphite) is now at an Indicated category which provides a strong foundation for future technical and economic studies," Mr Hearse said.

"This is a huge achievement for the business and an important milestone as we drive to establish ourselves as one of the first vertically integrated producers of battery anode graphite. These results

¹ 2% TGC cut off

show that Springdale has the Mineral Resource base to underpin our mine to market vision for decades to come.

Managing Director and CEO Andrew Worland said: “We set out to upgrade the existing Mineral Resource and expand it.

“To expand it by almost three-and-a-half times, improve the overall grade, and have over a quarter now classified as Indicated, is testament to a well planned and executed program by our technical team,” he said.

“We have only scratched the surface at Springdale.

“So far, exploration has been limited to approximately 10% of the Springdale tenement areas. More than 80% of the aeromagnetic anomalies (Figure 2) on a portion of our tenure has yet to be tested.

“It is notable that 10% of the new Mineral Resource estimate stems from an exciting new graphite discovery at Mason Bay, two kilometres east of Springdale. Further drilling will seek to expand this resource.

“Across our tenements, there is significant potential for further Mineral Resource growth to be defined if we follow the same exploration model.

“Graphite mineralisation at Springdale is fine flake and ideally suited to a streamlined flowsheet producing a single concentrate feedstock for downstream processing and the lithium-ion battery market.

“Our team is now working to optimise the mine development pathway, planning further infill and exploration drilling and integrating Springdale with the Company’s planned Graphite Battery Anode Facilities in Collie, Western Australia.”

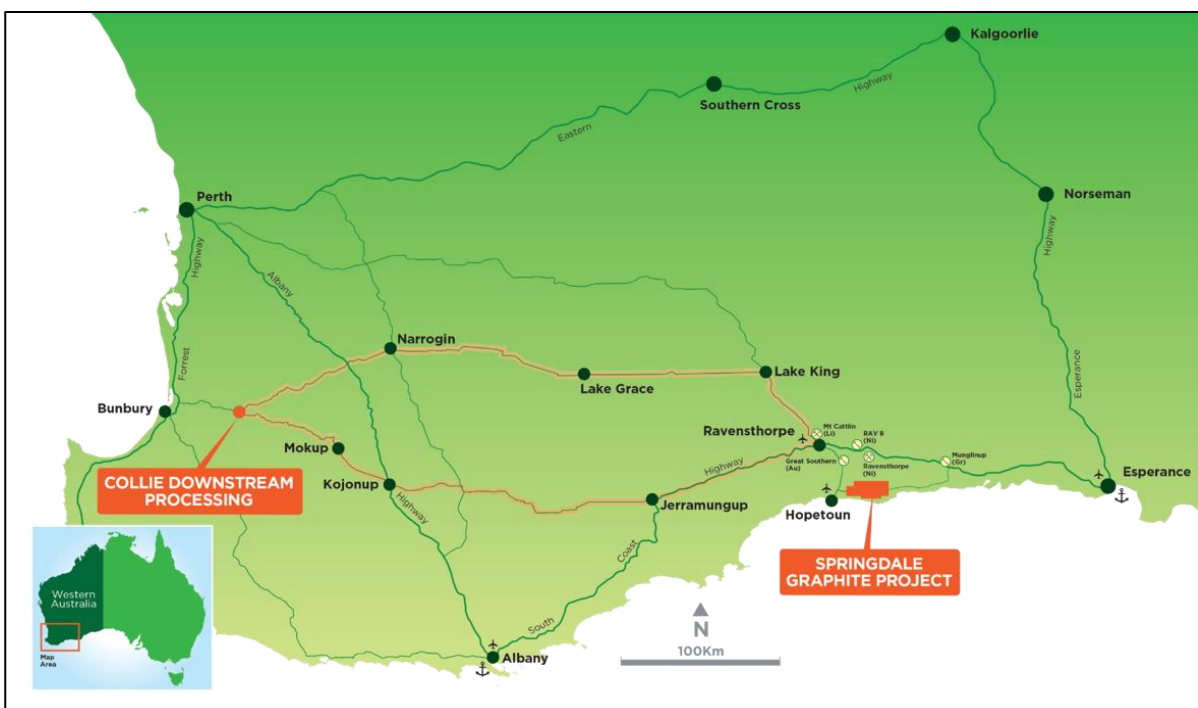

Figure 1: Location of Springdale Graphite Project

The new JORC 2012 compliant Mineral Resource estimate for the Springdale Graphite Project was prepared by independent consultancies OMNI GeoX Pty Ltd and Trepanier Pty Ltd resulting in the estimation of Indicated and Inferred Mineral Resources shown in Table 1 and Table 2 below. Table 3 presents a comparison with the historic resource and Table 4 details the new September 2023 Mineral Resource by oxidation profile. All figures presented in Tables 1 – 6 are rounded to one decimal place.

Table 1: Springdale JORC 2012 Mineral Resource estimate (using 2% TGC cut-off)

Classification	Springdale Graphite Project – September 2023		
	Tonnes (Mt)	Graphite (TGC%)	Contained Graphite (Mt)
Indicated	11.5	7.5	0.9
Inferred	37.8	6.1	2.3
Total	49.3	6.5	3.2

Table 2: Springdale JORC 2012 Mineral Resource estimate (using 5% TGC cut-off)

Classification	Springdale Graphite Project – September 2023		
	Tonnes (Mt)	Graphite (TGC%)	Tonnes (Mt)
Indicated	7.9	9.3	0.7
Inferred	20.1	8.5	1.7
Total	28.0	8.7	2.4

Table 3: Springdale JORC 2012 Mineral Resource estimate (using 2% TGC cut-off) – changes to previous estimate

	2018 Estimate			2023 Estimate			Variance

The drilling campaign at the Springdale Graphite Project was designed to upgrade the existing Springdale Mineral Resource estimate from Inferred to Indicated status and expand the Mineral Resource by exploring promising new areas that were highlighted in a 2019 airborne electromagnetic geophysical (AEM) survey.

The International Graphite program comprised 12 diamond drill (DD) holes and 261 reverse circulation (RC) drill holes for 20,574m of drilling. This Mineral Resource estimate includes drilling undertaken prior to International Graphite's ownership which consisted of 32 diamond holes and 129 RC / AC holes for 9,533 metres. Combined drilling to date is 44 diamond drill holes, 390 RC / AC holes for 30,107 metres at an average depth of 69 metres per hole.

Refer Figure 2 for drill hole locations, Appendix 1 for drill collar details and Appendix 2 for significant intercepts.

Significant exploration potential remains untested at the Springdale Graphite Project.

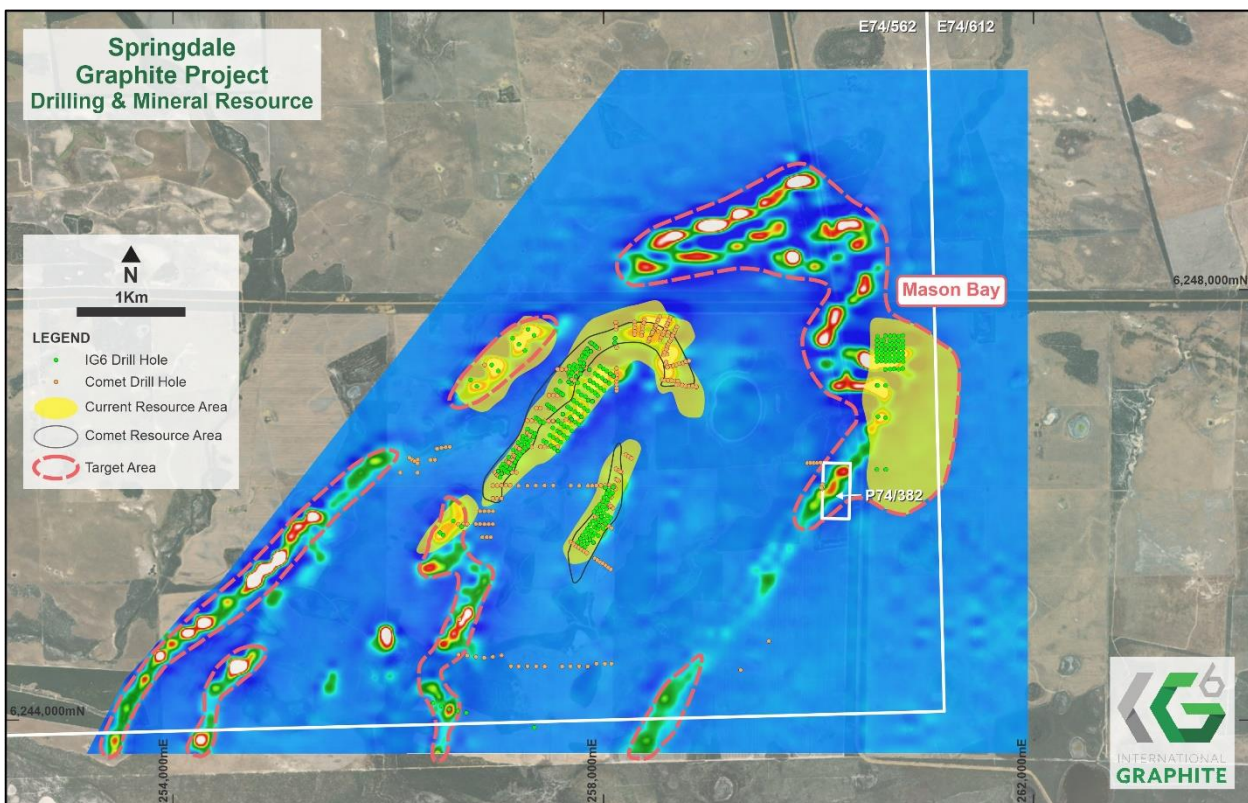

Figure 2: Springdale Drilling and Mineral Resource, with aeromagnetic survey and target areas

This announcement has been authorised for release by the Board of International Graphite Limited.

About International Graphite

International Graphite is an emerging supplier of processed graphite products, including battery anode material, for the global electric vehicle and renewable energy markets. The Company is developing a sovereign Australian 'mine to market' capability, with integrated operations wholly located in Western Australia. The Company intends to build on Australia's reputation for technical excellence and outstanding ESG performance with future mining and graphite concentrate production from its 100% owned Springdale Graphite Project and commercial scale downstream processing at Collie. International Graphite is listed on the Australian Securities Exchange (ASX: IG6) and Tradegate and Frankfurt Stock Exchange (FWB: H99, WKN: A3DJY5) and is a member of the European Battery Alliance (EBA250) and European Raw Minerals Alliance (ERMA).

Competent Persons Statement

The information in this announcement which relates to exploration targets, exploration results is based on information compiled by Mr. Darren Sparks. Mr. Sparks is the Principal Consultant and fulltime employee of OMNI GeoX Pty Ltd. He is a member of the Australian Institute of Geoscientists ("AIG"). Mr. Sparks has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (the JORC Code). Mr. Sparks consents to the inclusion of the information in this announcement in the form and context in which it appears.

The information in this report that relates to Mineral Resources is based on and fairly represents information compiled by Mr Peter Langworthy (Principal consultant and Managing Director of OMNI GeoX Pty Ltd) and Mr Lauritz Barnes (Consultant with Trepanier Pty Ltd). Mr Langworthy is a Member of the Australasian Institute of Mining and Metallurgy and Mr Barnes is a member of both the Australian Institute of Geoscientists and the Australian Institute of Mining and Metallurgy. Mr Langworthy and Mr Barnes both have sufficient experience of relevance to the styles of mineralisation and types of deposits under consideration and to the activities undertaken to qualify as Competent Persons as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Specifically, Mr Langworthy is the Competent Person for the field data collected, the database, the geological and mineralisation model, the classification and completed the site visits. Mr Barnes, also a Competent Person, reviewed the geological and mineralisation model, completed the estimation model, the classification and reporting. Mr Langworthy and Mr Barnes consent to the inclusion in this report of the matters based on their information in the form and context in which they appear.

The information in this document that relates to metallurgical test work managed by Battery Limits Pty Ltd (BL) is based on, and fairly represents, information and supporting documentation reviewed by Mr David Pass, who is a Member of The Australasian Institute of Mining and Metallurgy (AusIMM). Mr Pass is a fulltime employee of BL, who has been engaged by International Graphite Ltd to provide metallurgical consulting services. Mr Pass has approved and consented to the inclusion in this document of the matters based on his information in the form and context in which it appears.

SUMMARY OF MINERAL RESOURCE ESTIMATE AND REPORTING CRITERIA

As per ASX Listing Rule 5.8 and the 2012 JORC reporting guidelines, a summary of the material information used to estimate the Mineral Resource at the Springdale Graphite Project is detailed below.

GEOLOGY AND GEOLOGICAL INTERPRETATION

Regional Geology

The Springdale Graphite Project area geology forms part of the Northern Foreland lithotectonic unit of the Albany-Fraser Orogeny and is dominated by the Archaean Mungrinup Gneiss. The Northern Foreland represents reworked Yilgarn Craton, as evidenced in the Project area by the presence of the remnant, northerly trending Jerdacuttup Greenstone Belt.

Project Geology

The Mungrinup Gneiss present within the Springdale Graphite Project area comprises hornblende and garnet-bearing felsic gneiss, amphibolite, quartzite, carbonate-silicate rocks and marble. Graphite mineralisation is stratigraphic in nature and hosted by a metasedimentary graphitic schist with typical Total Graphitic Carbon (TGC) grades ranging from 15-40%. This schist unit is variably carbonate-altered resulting in increased competency compared to the surrounding gneiss in the weathered part of the profile. A lower-grade graphite zone is present around the main graphitic schist units where graphite exists as mobilised disseminated graphite and/or thinner stratigraphic horizons. TGC grades in the lower grade zone typically range from 2-10% TGC.

A high-resolution aeromagnetic survey was flown by the former owner of the project Comet Resources Limited in September 2017. The key features revealed from this survey were that the stratigraphy is tightly folded with NE-trending fold axes and that graphite-rich stratigraphy is strongly associated with units of low magnetic response in the project area (Figure 2).

The aeromagnetic survey could not differentiate between anticlines and synclines. Drilling has revealed that the graphite-rich stratigraphy is part of a kilometre-scale syncline with the Western and Eastern limb striking at around 030° and dipping moderately (around 45°) to the SE. The dip of stratigraphy in the fold hinge shallows significantly to 15° to the south.

The confidence of the geological interpretation of graphitic horizons is considered robust for the purpose of estimated and reporting Indicated and Inferred resources. Graphite is hosted stratigraphically within graphitic schists and gneiss. The location of drilling intercepts of graphitic stratigraphy confirms the anticipated position of the lenses. Graphite-rich stratigraphy sits within distinct magnetic lows which can be interpreted from high resolution aeromagnetic and electromagnetic (EM) data that covers the project area. Continuity of mineralisation is affected by stratigraphic position and structural position with thickening of prospective units occurring in fold closures. The boundary between graphitic schists and gneiss is usually sharp leaving few options to move the position of interpreted mineralisation. Alternative interpretation has been considered but have less confidence in the geology than the current interpretation at present. Mineralization wireframes were created in Leapfrog™. The weathered horizons (base of oxidation, transitional and top of fresh) have been generated from geological logging of AC, RC and DD holes.

DRILLING TECHNIQUES

The Springdale drill data base utilised in Mineral Resource estimation includes 390 RC (26,949m), 44 DD (3,158m).

2016-2019

RC drill holes were completed by Three Rivers Drilling using a Schramm T450 RC drill rig with an onboard 900psi / 2200cfm compressor and Westside Drilling using a 2002 MK10 Atlas Copco RC drill rig with an onboard Atlas Copco XRVS 900/350 psi compressor. An auxiliary booster was used on the majority of holes deeper than 70m. The majority of drilling was carried out using a 100mm RC face sampling hammer. When clays became problematic, a 100mm blade bit was used.

DD holes were completed by ONQ Exploration Solutions using a Desco 7000 rig. Triple tube HQ and PQ core were recovered. DD was conducted with Rotary Mud (Mr) pre-collars. DD and MR was completed by DDH1 Drilling using a track mounted Sandvick DE710 diamond rig (Rig42). Core size was PQ3 (85mm diameter) and HQ3 (61.1mm diameter) triple tube system. All inclined holes were oriented using a True Core PQ or HQ orientation tool, TC0999/TC0156. Due to deeply oxidised nature of the core not all orientations were successful, so the majority of the core remains un-orientated. Where orientated a dip and dip direction structural measurement were collected using a rocket launcher style CORE Orientation device or cradle.

AC drill holes were completed by ONQ Exploration Solutions using an Edson 200 rig with a 400/200 compressor and a 90mm AC blade or hammer bit.

2022-2023

DD was completed by Seismic Drilling Australia using a track mounted D&B 16-M (Rig 7). Core size was PQ3 (85mm diameter) triple tube system. All inclined holes were oriented using a H or N Ori – Ori Kit orientation tool (5233). Due to the deep oxidised nature of the core not all orientations were successful, so much of the core remains un-orientated. Where oriented successfully alpha and beta structural measurements were collected using a PQ goniometer, this then was converted in the database to dip and dip direction.

RC drill holes were completed by Three Rivers Drilling using a Schramm T450 RC drill rig with an onboard 900psi / 2200cfm compressor. An auxiliary booster was used on most holes deeper than 70m.

RC drill holes were completed by Strike Drilling using a X350 RC (3.5" drill pipe) drill rig mounted on a VD3000 Morooka track, with an onboard 400psi / 1240cfm compressor and also using a LC36 (KWL 700) RC (4.5" drill pipe) drill rig mounted on a Mercedes actross 8x8 truck, with an onboard 500psi / 1350cfm compressor. An auxiliary and booster was used on the majority of holes deeper than 70m.

Where RC and/or DD drill coverage was insufficient AC holes were used to guide geology and mineralisation but where not used in the resource estimation.

SAMPLING AND SUB-SAMPLING TECHNIQUES

All RC and AC one-metre sub-samples from drill holes were collected from a cone or rotary splitter respectively, to produce an ~15% routine split sample for analysis. Diamond core one-metre (or smaller) samples were collected by diamond core quartering in competent material, or diamond core halving in broken or friable material. All diamond samples were marked up on core and core trays (where difficult to write on) with paint markers and photographed before core trays were sent to ALS and Nagrom for cutting and sampling.

Quality Control and Quality Assurance (QAQC) procedures implemented to check sampling and assaying precision included duplicate samples (predominately using the same sub-sampling method) and course/pulp repeats. Sampling quality was also monitored using sample pulp sizing data and internal laboratory blanks. Review of this QAQC data has revealed that sample repeatability is

acceptable and improved at higher grades, whilst the performance of blanks is very good and sample preparation (pulverisation) is acceptable.

All samples were weighed on arrival at ALS and Nagrom laboratories Perth and the weights recorded along with analytical results. Samples were not weighed on arrival at Lab West. Routine sample preparation included drying, coarse crushing (-6mm) and total sample pulverisation (nominal 90% passing -75µm) and splitting to prepare a pulp of approximately 200 grams. ALS Perth sent the 200g pulps to be analysed at ALS Laboratories in Brisbane, Queensland, Australia. The sample sizes are considered to be appropriate to adequately represent the mineralisation style under investigation.

SAMPLE ANALYSIS METHOD

ALS laboratories performed TGC assays on all routine and related QAQC samples. TGC analyses were performed using the Leco Method, in which carbonates are destroyed by treatment with hydrochloric acid and organic carbon is converted to carbon dioxide and eliminated by heating in air at 400° in a Leco furnace. Nagrom laboratory performed Total Graphitic Carbon Assays on all routine and related QAQC samples. A labfit CS2000 combustion/IR analyser was used for Graphitic carbon analysis. For TC and TGC, the prepared sample is dissolved in HCL over heat until all carbonate material is removed. The residue is then heated to drive off organic content. The final residue is combusted in oxygen with a Carbon-Sulphur Analyser and analysed for Total Graphitic Carbon (TGC), Total Sulphur (TS) and Total Carbon (TC). Lab West laboratory performed Total Graphitic Carbon Assays on all routine and related QAQC samples. A labfit CS1232 combustion/IR analyser was used for Graphitic carbon analysis. For TC and TGC, the prepared sample is dissolved in HCL over heat until all carbonate material is removed. The residue is then heated to drive off organic content. The final residue is combusted in oxygen with a Carbon-Sulphur Analyser and analysed for Total Graphitic Carbon (TGC), Total Sulphur (TS) and Total Carbon (TC). This is an accepted industry analytical process appropriate for the determination of TGC and suitable for the nature and style of mineralisation under investigation.

The 113 samples that were analysed at Nagrom from 2022 drilling were also analysed by Lab West.

In addition to the QAQC procedures mentioned above relating to sampling precision and quality, assaying accuracy was monitored using Certified Reference Materials (CRM) submitted by CRL and IG6 with each sample batch and the additional use of internal CRMs by the laboratory. A review of all CRM samples has revealed that lab internal quality control procedures were satisfactory and that an acceptable level of accuracy has been achieved.

CUT-OFF GRADES

Graphite boundaries typically coincide with anomalous TGC $\geq 2\%$ which allows for geological continuity of the mineralised zones. All Graphite unit (and grade) models were built in Leapfrog™ Geo software and exported for use as domain boundaries for the block model. The resource has been reported above the mineralised cut-off grade of $\geq 2\%$ TGC.

ESTIMATION METHODOLOGY

Grade estimation was by Ordinary Kriging for TGC and TS using GEOVIA Surpac™ software. The estimate was resolved into 5m (E) x 10m (N) x 10m (RL) parent cells that had been sub-celled at the domain boundaries for accurate domain volume representation. Top-cuts were decided by completing an outlier analysis using a combination of methods including grade histograms, log probability plots and other statistical tools. Based on this statistical analysis of the data population, no top-cuts were applied. Estimation parameters were based on variogram models, data geometry and kriging estimation statistics. The search orientation utilised Dynamic Anisotropy and follow the trend of each graphite unit.

The bulk densities assigned were based on analysis of Archimedes measurements on both non-porous core samples and porous samples that were either wax coated or plastic wrapped. The bulk densities assigned to the model used a regression against depth below surface to 70m depth, and then an assigned bulk density for anything greater than 70m below surface, as follows:

- 0m to 70 below surface: $BD = (0.0086 \times \text{Depth Below Surface}) + 1.357$
- 70 below surface: $BD = 2.0$

CLASSIFICATION CRITERIA

The Mineral Resource has been classified on the basis of confidence in the geological model, continuity of mineralised zones, drilling density, confidence in the underlying database and the available bulk density information. Indicated Mineral Resources are defined nominally on 25m E x 40m N up to 40m E x 80m N spaced drilling and Inferred Mineral Resources nominally up to 40m across strike x 100m to 150m along strike with consideration always given for the confidence of the continuity of geology and mineralisation. Consideration to the Reasonable Prospects of (Eventual) Economic Extraction (RPEEE) as described by the JORC Code (2012). The cut-off grade (COG) adopted is $\geq 2\%$ TGC. Graphite-rich stratigraphy has been shown to be continuous for significant distances via completed aircore, RC and DD. Mineralised stratigraphy has been interpreted successfully from aeromagnetic and (airborne and ground) electromagnetic surveys. Drill-spacing in each area is considered adequate for an Indicated and Inferred Resource classification. Excessive extrapolation has not been undertaken with mineralised zones only modelled to 150m below the ground surface where there was drill support depth. Along strike mineralisation domains were extended halfway between drill lines or up to approximately 200m beyond a drill line where there was support for stratigraphic continuity from aeromagnetic and EM interpretation.

The Mineral Resource estimate appropriately reflects the view of the Competent Person.

MINING METHOD AND METALLURGICAL METHODS AND PARAMETERS

Based on the orientations, thicknesses and depths to which the graphitic lenses have been modelled and their estimated TGC, the potential mining method is considered to be open pit mining. No metallurgical assumptions have been built into the resource models. The results from metallurgical testwork have been considered for Mineral Resource classification.

Metallurgical testwork has been conducted on both RC and DD core samples and the results using conventional froth flotation have demonstrated the ability to produce high grade graphite concentrates that are predominately fine (<150 micron) and at grades up to 97% TGC. The concentrates produced would be considered a saleable graphite product.

Further, additional downstream testwork on graphite concentrates produced from Springdale samples indicate that the graphite concentrates produced would be amenable to produce micronised and spherical graphite products.

Note: Intercepts widths are downhole, calculated with a minimum of 1 metre of internal waste using a 2% TGC cut-off.

APPENDIX 3: JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> • <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> • <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> • <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> • <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> 	<p>The mineral resource estimate was based on data collected from reverse circulation (RC) and diamond core (DD) drill holes.</p> <p>All drill holes were completed by Comet Resources Limited (CRL) during the period 2016 to 2019. Sampling was performed at a uniform 1m interval in RC and AC drilling. In DD individual sample intervals including graphitic zones were sampled based on logged geology intervals and can vary from 0.3m - 1.5m with the majority of samples at 1m intervals. Sampling techniques performed are considered to be of an industry standard and were conducted or supervised by qualified geological personnel. Reverse circulation drilling produced samples that were collected at one-metre intervals using a cone splitter to produce an approximate three-kilogram sample, which is considered representative of the full drill metre. Core was cut at ALS and Nagrom from Comet specified cut sheets using either a automatic diamond core saw where competent, manually by hand using a paint scraper, where soft and friable (oxidised clays). Diamond drilling (HQ and PQ) produced samples that were cut into ½ core; one side of ½ core then being cut to produce two sections of ¼ core. The ¼ core was sampled to produce an approximate two kilogram sample, which is considered representative of the full drill metre. Some half core was used for routine samples in instances where core was broken or highly weathered (friable or clay-rich). Aircore drilling produced samples that were collected at one-metre intervals using a cone splitter to produce an approximate three-kilogram sample, which is considered representative of the full drill metre. Drill samples selected for analysis were limited to those containing visible graphite, together with a buffer of barren country rock. Analyses were undertaken by ALS Perth, ALS Brisbane and Nagrom Laboratories Perth which included Total Graphitic Carbon, Total Carbon, Total Sulphur with selected Au, base metal and multi-element analyses.</p> <p>All drill holes were completed by International Graphite Limited (IG6) during the period 2022 to 2023. Diamond drilling was done to collect adequate samples for metallurgical and ore characterisation test work.</p>

Criteria	JORC Code explanation	Commentary
		<p>Individual sample intervals including graphitic zones were sampled based on logged geology intervals and can vary from 0.2m to 1.2m.</p> <p>Samples were ¼ PQ3 and were cut and sampled onsite using either an automatic diamond core saw where competent, or manual by hand using a paint scraper, where soft and friable (oxidised clays)</p> <p>Core was first cut in half lengthwise and then one half was cut in half again for the ¼ core sample. This produced an approximately 2kg sample which is considered representative of the full drill metre interval sampled.</p> <p>Drill samples selected for analysis were limited to those containing visible graphite, together with a buffer zone into barren country rock.</p> <p>Graphite quality and rock classification were visually determined by field geologist.</p> <p>Reverse circulation drilling produced samples that were collected at one-metre intervals using a cone splitter to produce an approximate three-kilogram sample, which is considered representative of the full drill metre.</p> <p>Drill samples selected for analysis were limited to those containing visible graphite, together with a buffer of barren country rock. Analyses were undertaken by Nagrom and Lab West laboratories Perth and included Total Graphitic Carbon, Total Carbon and Total Sulphur.</p>
Drilling techniques	<ul style="list-style-type: none"> • Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<p>The Springdale drill data base utilised in resource estimation includes 390 RC (26,949m), 44 DD (3,160.68m)</p> <p>2016-2019</p> <p>RC drill holes were completed by Three Rivers Drilling using a Schramm T450 RC drill rig with an onboard 900psi / 2200cfm compressor. Also Westside Drilling using a 2002 MK10 Atlas Copco RC drill rig with an onboard Atlas Copco XRVS 900/350 psi compressor. An auxiliary booster was used on the majority of holes deeper than 70m. The majority of drilling was carried out using a 100mm RC face sampling hammer. When clays became problematic, a 100mm blade bit was used.</p> <p>DD holes were completed by ONQ Exploration Solutions using a Desco 7000 rig. Triple tube HQ and PQ core were recovered. Diamond drilling (DD) was</p>

Criteria	JORC Code explanation	Commentary
		<p>conducted with Rotary Mud (Mr) pre-collars. DD and MR was completed by DDH1 Drilling using a track mounted Sandvick DE710 diamond rig (Rig42). Core size was PQ3 (85mm diameter) and HQ3 (61.1mm diameter) triple tube system. All inclined holes were oriented using a True Core PQ or HQ orientation tool, TC0999/TC0156. Due to deeply oxidised nature of the core not all orientations were successful, so the majority of the core remains un-orientated. Where orientated a dip and dip direction structural measurement were collected using a rocket launcher style CORE Orientation device or cradle.</p> <p>AC drill holes were completed by ONQ Exploration Solutions using an Edson 200 rig with a 400/200 compressor and a 90mm AC blade or hammer bit.</p> <p>2022-2023</p> <p>Diamond Drilling (DD) was completed by Seismic Drilling Australia using a track mounted D&B 16-M (Rig 7). Core size was PQ3 (85mm diameter) triple tube system. All inclined holes were oriented using a H or N Ori – Ori Kit orientation tool (5233). Due to the deep oxidised nature of the core not all orientations were successful, so much of the core remains un-orientated. Where oriented successfully alpha and beta structural measurements were collected using a PQ goniometer, this then was converted in the database to dip and dip direction.</p> <p>RC drill holes were completed by Three Rivers Drilling using a Schramm T450 RC drill rig with an onboard 900psi / 2200cfm compressor. An auxiliary booster was used on most holes deeper than 70m.</p> <p>RC drill holes were completed by Strike Drilling. Using a X350 RC (3.5" drill pipe) drill rig mounted on a VD3000 Morooka track, with an onboard 400psi / 1240cfm compressor. Also using a LC36 (KWL 700) RC (4.5" drill pipe) drill rig mounted on a Mercedes actross 8x8 truck, with an onboard 500psi / 1350cfm compressor. An auxiliary and booster was used on the majority of holes deeper than 70m.</p> <p>Where RC and/or DD drill coverage was insufficient AC holes were used to guide geology and mineralisation but where not used in the resource estimation.</p>
Drill sample recovery	<ul style="list-style-type: none"> • <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> • <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> 	<p>RC and AC recoveries were considered good, with available air for drill sample recovery being deemed adequate for the ground conditions and depth of sampling undertaken. DD core recoveries were recorded over core runs and were good in fresh and moderately weathered material. Core recovery was reduced in some instances in highly weathered clay zones and this has been taken into consideration during resource estimation procedures. Appropriate</p>

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<p>measures have been undertaken to maximise sample recovery and ensure the representative nature of samples, including:</p> <ul style="list-style-type: none"> terminating RC and AC holes in the advent of reduced recovery at depth; utilising triple tube DD core methods and tailoring run lengths to ground conditions (e.g. short runs in clay-rich or broken ground); and increasing core diameter (PQ rather than HQ) for holes targeting mineralisation in shallow highly weathered material. In 2019 twin holes comparison of RC vs Diamond indicated that there is no sample bias for graphite assays <p>No apparent relationship is seen between sample recovery and grade. A problem may exist with loss of graphite due to high water flows during drilling.</p>
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. 	<p>Geological logging of the drill chips and core were recorded by a geologist for all holes and included description of lithology, mineralogy, veining, alteration, structure, grainsize, texture, weathering, oxidation, colour and other features of the samples. MR pre-collars were bagged from the collar water and logged but not sampled. Logging of RC and AC drill chips is considered to be semi-quantitative, given the nature of rock chip fragments, whilst logging of DD is considered quantitative in nature. All diamond core was photographed (wet and dry). All RC holes drilled by IG6 were photographed (wet). All drill holes were logged in their entirety (100%) and this logging is considered reliable and appropriate for the mineral resource estimate study undertaken. Geotechnical logging has not been undertaken.</p>
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to 	<p>All RC and AC one-metre sub-samples from drill holes were collected from a cone or rotary splitter respectively, to produce an ~15% routine split sample for analysis. Diamond core one-metre (or smaller) samples were collected by diamond core quartering in competent material, or diamond core halving in broken or friable material. All diamond samples were marked up on core and core trays (where difficult to write on) with paint markers and photographed before core trays were sent to ALS and Nagrom for cutting and sampling.</p> <p>Quality Control and Quality Assurance (QAQC) procedures implemented to check sampling and assaying precision included duplicate samples</p>

Criteria	JORC Code explanation	Commentary
	<p><i>maximise representivity of samples.</i></p> <ul style="list-style-type: none"> • <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i> • <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> 	<p>(predominately using the same sub-sampling method) and course/pulp repeats. Sampling quality was also monitored using sample pulp sizing data and internal laboratory blanks. Review of this QAQC data has revealed that sample repeatability is acceptable and improved at higher grades, whilst the performance of blanks is very good and sample preparation (pulverisation) is acceptable.</p> <p>All samples were weighed on arrival at ALS and Nagrom laboratories Perth and the weights recorded along with analytical results. Samples were not weighed on arrival at Lab West. Routine sample preparation included drying, coarse crushing (-6mm) and total sample pulverisation (nominal 90% passing -75µm) and splitting to prepare a pulp of approximately 200 grams. ALS Perth sent the 200g pulps to be analysed at ALS Laboratories in Brisbane, Queensland, Australia. The sample sizes are considered to be appropriate to adequately represent the mineralisation style under investigation.</p>
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> • <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> • <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> • <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i> 	<p>ALS laboratories performed Total Graphitic Carbon (TGC) assays on all routine and related QAQC samples. TGC analyses were performed using the Leco Method, in which carbonates are destroyed by treatment with hydrochloric acid and organic carbon is converted to carbon dioxide and eliminated by heating in air at 400° in a Leco furnace. Nagrom laboratory performed Total Graphitic Carbon Assays on all routine and related QAQC samples. A labfit CS2000 combustion/IR analyser was used for Graphitic carbon analysis. For TC and TGC, the prepared sample is dissolved in HCL over heat until all carbonate material is removed. The residue is then heated to drive off organic content. The final residue is combusted in oxygen with a Carbon-Sulphur Analyser and analysed for Total Graphitic Carbon (TGC), Total Sulphur (TS) and Total Carbon (TC). Lab West laboratory performed Total Graphitic Carbon Assays on all routine and related QAQC samples. A labfit CS1232 combustion/IR analyser was used for Graphitic carbon analysis. For TC and TGC, the prepared sample is dissolved in HCL over heat until all carbonate material is removed. The residue is then heated to drive off organic content. The final residue is combusted in oxygen with a Carbon-Sulphur Analyser and analysed for Total Graphitic Carbon (TGC), Total Sulphur (TS) and Total Carbon (TC). This is an accepted industry analytical process appropriate for the determination of TGC and suitable for the nature and style of mineralisation under investigation.</p> <p>113 samples that were analysed at Nagrom from 2022 drilling were also analysed by Lab West.</p>

Criteria	JORC Code explanation	Commentary
		In addition to the QAQC procedures mentioned above relating to sampling precision and quality, assaying accuracy was monitored using Certified Reference Materials (CRM) submitted by CRL and IG6 with each sample batch and the additional use of internal CRMs by the laboratory. A review of all CRM samples has revealed that lab internal quality control procedures were satisfactory and that an acceptable level of accuracy has been achieved.
Verification of sampling and assaying	<ul style="list-style-type: none"> • The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. • Discuss any adjustment to assay data. 	<p>In 2019 Scissor twin holes were used to obtain metallurgical samples in the areas of known graphite mineralisation. Although not true twins, the holes have been verified the previously reported mineralisation intersections and provided additional geometry information.</p> <p>A tailored structured database was devised for the storage of all Springdale digital drilling information. The database features a hierarchical database structure and procedures and data validation features designed to collate and maintain the integrity of all Springdale drill data.</p> <p>No adjustment has been made to assay data.</p>
Location of data points	<ul style="list-style-type: none"> • Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control. 	<p>The 2016-early 2019 drill hole sites have been located using a Navcon SF-3050 unit used for DGPS/DGNSS surveying. The recorded locations used the MGA94 Zone 51 datum and the 1971 AHD. Accuracy is estimated at approximately, 10 cm.</p> <p>In the case of diamond drill holes 2016-2018, regular down-hole surveys (dip and azimuth) were collected using a single shot magnetic survey tool. A time-dependent declination was applied to magnetic readings to determine MGA94 Zone 51 azimuths.</p> <p>2019-2023 collar positions were set out using a handheld Garmin GPS with a reported accuracy of 5m and reported using MGA94 Zone 51. Two pegs were lined up using a Suunto sighting compass and tape laid out on the ground between the pegs to align the rig. Final collar position was recorded using a handheld Garmon GPS. For inclined holes downhole surveys (dip and azimuth) were taken using a non-magnetic AXIS Champ Gyro. 2022-2023 most holes were picked up by a qualified surveyor with a DGPS with an accuracy of approximately 10cm.</p>

Criteria	JORC Code explanation	Commentary
<i>Data spacing and distribution</i>	<ul style="list-style-type: none"> • <i>Data spacing for reporting of Exploration Results.</i> • <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> • <i>Whether sample compositing has been applied.</i> 	<p>In the Western Zone drilling has been completed on 40 – 160m spaced drill lines roughly perpendicular to strike with holes nominally 40m apart</p> <p>In the Northern Zone drilling has been completed on 100 – 200m spaced drill lines roughly perpendicular to strike with holes nominally 30m apart</p> <p>In the Eastern Zone drilling has been completed on 40 – 160m spaced drill lines roughly perpendicular to strike with holes nominally 40m apart</p> <p>In the Central Zone drilling has been completed on 80-160m spaced drill lines roughly perpendicular to strike with holes nominally 40m apart</p> <p>In the Far West Zone drilling has been completed on 160-320m spaced drill lines roughly perpendicular to strike with holes nominally 80m apart</p> <p>In the South Zone drilling has been completed on 160m spaced drill lines roughly perpendicular to strike with holes nominally 80m apart</p> <p>In the Mason Bay Zone drilling has been completed on 40-320m spaced drill lines roughly perpendicular to strike with holes nominally 40-80m apart</p> <p>This spacing and distribution is considered sufficient for indicated and Inferred mineral resource estimations.</p>
<i>Orientation of data in relation to geological structure</i>	<ul style="list-style-type: none"> • <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> • <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> 	<p>The orientation of the drilling is not expected to introduce sampling bias. Most drill holes have intersected the mineralisation at a sufficient angle to the strike and dip of the mineralised units.</p>
<i>Sample security</i>	<ul style="list-style-type: none"> • <i>The measures taken to ensure sample security.</i> 	<p>All samples were collected in calico sample bags with sample number identification on the bag.</p> <p>2016 - early 2019 bags were then checked against field manifests and loaded into plastic bags for transportation to ALS sample preparation in Perth WA (transported by Comet staff). Bags were checked on receipt by ALS and any discrepancies relative to the field manifest addressed/resolved.</p>

Criteria	JORC Code explanation	Commentary
		<p>Late 2019-2023 bags were then checked against field manifests and loaded into plastic bags for transportation to Nagrom and Lab West sample preparation in Perth WA (transported by FLG). Supervised by Comet and then OMNI GeoX personnel. Bags were checked on receipt by Nagrom Lab West and any discrepancies relative to the field manifest addressed/resolved.</p> <p>Security over sample dispatch is considered adequate for these samples at this time.</p>
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	The program is continuously reviewed by senior company personnel.

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<p>Exploration license E74/562 that holds the Springdale Resource is current and 100% owned by International Graphite Ltd on conclusion of the IPO transaction with Comet Resources Ltd.</p> <p>Exploration license E74/612 adjoins E74/562 to the east. The tenement does not currently have any identified resources, however considerable exploration potential exists.</p> <p>The Project is largely covered by Freehold Agricultural properties with minor corridors of Shire roads and associated easements.</p> <p>Preliminary environmental studies have identified limited areas that will require additional environmental assessment prior to any further work.</p> <p>E74/0612 was granted subject to conditions requiring the Holder enter into Indigenous Land Use Agreements with the Wagyl Kaip Southern Noongar People and the Esperance Nyungars prior to exercising any of the rights, powers or duties pursuant to the licence.</p>

Criteria	JORC Code explanation	Commentary
		There are no outstanding issues regarding access or ownership on the targeted land.
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> <i>Acknowledgment and appraisal of exploration by other parties.</i> 	<p>Unpublished and verbal reports of graphite mineralisation encountered in shallow calcrete/limestone drilling and extractive industry operations at the Springdale Project.</p> <p>All information in the Independent Technical Assessment Report relating to resource estimation and exploration activities were completed by Comet Resources Limited.</p> <p>The work has been reviewed by OMNI GeoX and is considered to meet the requirements under the JORC Code 2012 and Valmin 2015 requirements.</p>
<i>Geology</i>	<ul style="list-style-type: none"> <i>Deposit type, geological setting and style of mineralisation.</i> 	<p>Archaean greenstone belt and the surrounding Archaean Munglinup Gneiss which encapsulates the Belt. The greenstone belt is located within the deformed southern margin of the Yilgarn Craton and constitutes part of the Northern Foreland lithotectonic unit of the Albany-Frazer Orogen. Two different mineral deposit models are proposed:</p> <ul style="list-style-type: none"> A - Archaean style gold, nickel copper mineralisation in remnant greenstone and reworked Yilgarn Craton rocks; and B - Graphite mineralisation within metamorphosed Archaean granitic, mafic and sedimentary rocks. <p>Additionally, the collection of exploration data was done in such a way that additional deposits such as Intrusive related nickel-copper-PGE deposits and rare earth deposits will be identified if present.</p> <p>A high-resolution aeromagnetic survey flown in September 2017 showed that stratigraphy is tightly folded with NE-trending fold axis that graphite-rich stratigraphy is strongly associated with units of low magnetic response in the project area. Drilling has revealed that the graphite-rich stratigraphy is part of a kilometre-scale syncline with the western and Eastern limb striking around 30° and dipping moderately (around 45°) to the SE. the dip of the stratigraphy in the fold hinge shallows significantly to 15° to the South.</p>
<i>Drill hole Information</i>	<ul style="list-style-type: none"> <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information</i> 	No new exploration results have been reported in this release.

Criteria	JORC Code explanation	Commentary
	<p><i>for all Material drill holes:</i></p> <ul style="list-style-type: none"> o <i>easting and northing of the drill hole collar</i> o <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> o <i>dip and azimuth of the hole</i> o <i>down hole length and interception depth</i> o <i>hole length.</i> • <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i> 	<p>A summary of all exploration holes used in the mineral resource is included as Appendix 1.</p>
<i>Data aggregation methods</i>	<ul style="list-style-type: none"> • <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> • <i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> • <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> 	<ul style="list-style-type: none"> • No new exploration results have been reported in this release. • The listing of the entire drill hole database used to estimate the resource was not considered relevant for this release. • Intersections are calculated as a weighted average, using a 1% TGC cut-off and a maximum 1m consecutive internal waste in Appendix 2. • No upper cut-off was used
<i>Relationship between mineralisation widths and intercept lengths</i>	<ul style="list-style-type: none"> • <i>These relationships are particularly important in the reporting of Exploration Results.</i> • <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> • <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg ‘down hole length, true width not known’).</i> 	<ul style="list-style-type: none"> • Any intersections included in this report are downhole lengths. The true widths of these intersections are not known.

Criteria	JORC Code explanation	Commentary
<i>Diagrams</i>	<ul style="list-style-type: none"> <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> 	<ul style="list-style-type: none"> Relevant maps, diagrams and tabulations are included in the body of this report.
<i>Balanced reporting</i>	<ul style="list-style-type: none"> <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i> 	<ul style="list-style-type: none"> A summary of drill hole details and results used in the minerals resource have been included in this announcement in appendices 1 & 2.
<i>Other substantive exploration data</i>	<ul style="list-style-type: none"> <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> 	<ul style="list-style-type: none"> Other exploration data collected by the Company is not considered as material to this report at this stage. Further data collection will be reviewed and reported when considered material.
<i>Further work</i>	<ul style="list-style-type: none"> <i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	<ul style="list-style-type: none"> Depth and strike extension drilling is under review as well as the testing of undrilled targets. External review of geology model and estimation as part of feasibility studies.

Section 3 Estimation and Reporting of Mineral Resources

Criteria	JORC Code explanation	Commentary
<i>Database integrity</i>	<ul style="list-style-type: none"> <i>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</i> <i>Data validation procedures used.</i> 	<p>The original drilling database has been in place since inception of the Springdale Project in 2016. The Springdale deposit drill and survey databases used Microsoft Access, a relational database management system operating under Windows. The database is routinely checked and validated internally by various methods, including cross-validation during uploading into the CRL resource estimation software database (Datamine). These check and validation runs have not encountered any major errors and indicate that the data-loading undertaken was free of errors that would significantly affect resource estimation.</p>

Criteria	JORC Code explanation	Commentary
		<p>Since 2019, the data has been imported into a relational SQL Server database using Datashed™ (industry standard drill hole database management software). Initially drilling data was supplied in paper then transferred over to digital Excel templates, using drop down lists to verify codes. IG6 then implemented the OCRIS data logging software system which validates the data before it is imported to the SQL database. The data are constantly audited and any discrepancies checked by OMNI GeoX personnel before being updated in the database.</p> <p>Normal data validation checks were completed on import to SQL database. Historical data have not checked back to hard copy results but have been checked against previous database supplied by CRL. All logs are supplied as excel spreadsheets/OCRIS files and any discrepancies checked and corrected by field personnel.</p>
Site visits	<ul style="list-style-type: none"> • <i>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</i> • <i>If no site visits have been undertaken indicate why this is the case.</i> 	<ul style="list-style-type: none"> • Darren Sparks is employed by OMNI GeoX Pty Ltd and contracted by IG6 as the Exploration Manager. He has visited site on numerous occasions and overseen the majority of the drilling included in the Resource Estimate. Peter Langworthy is employed by OMNI GeoX Pty Ltd and contracted by IG6 as the competent person. He wrote the independent geology report and has visited site numerous times during 2021-2023. • Peter Langworthy is employed by OMNI GeoX Pty Ltd and contracted by IG6 as the competent person. He wrote the independent geology report and has visited site numerous times during 2021-2023.
Geological interpretation	<ul style="list-style-type: none"> • <i>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</i> • <i>Nature of the data used and of any assumptions made.</i> • <i>The effect, if any, of alternative interpretations on Mineral Resource estimation.</i> • <i>The use of geology in guiding and controlling Mineral Resource estimation.</i> • <i>The factors affecting continuity both of grade and geology.</i> 	<ul style="list-style-type: none"> • The confidence of the geological interpretation of graphitic horizons is considered is considered robust for the purpose of estimated and reporting Indicated and Inferred resources. • Graphite is hosted stratigraphically within graphitic schists and gneiss. • The location of drilling intercepts of graphitic stratigraphy confirms the anticipated position of the lenses. • Graphite-rich stratigraphy sits within distinct magnetic lows and electromagnetic highs which can be interpreted from high resolution aeromagnetic and electromagnetic data that covers the project area. The electromagnetic data was used to produce conductors which was used to target and model to. Continuity of mineralisation is affected by stratigraphic

Criteria	JORC Code explanation	Commentary
		<p>position and structural position with thickening of prospective units occurring in fold closures.</p> <ul style="list-style-type: none"> The boundary between graphitic schists and gneiss is usually sharp leaving few options to move the position of interpreted mineralisation. Alternative interpretation has been considered but have less confidence in the geology that the current interpretation at present. Grade wireframes were created in Leapfrog™. The weathered horizons (base of oxidation, transitional and top of fresh) have been generated from geological logging of AC, RC and DD holes.
Dimensions	<ul style="list-style-type: none"> <i>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.</i> 	<ul style="list-style-type: none"> The mineral resource encompasses the parts of the Springdale Project that have been drill tested. This includes approximately 4 kilometres of stratigraphy that exists within a tightly folded sequence. The majority of drilling has been completed on the western limb and fold nose of a regional syncline with a NE-tending fold axes The Springdale Project mineralisation has been modelled in six spatial domains due to changes in orientation of the stratigraphy (Western, Northern and Eastern). Modelled Western Zone mineralisation has a strike of 1700m and has been interpreted to a nominal depth of 150m below the ground surface with typical widths of 5-20m. Modelled Northern Zone mineralisation has a strike of 1000m and has been interpreted to a nominal depth of 150m below the ground surface with typical widths of 5-30m. Modelled Eastern Zone mineralisation has a strike of 1000m and has been interpreted to a nominal depth of 150m below the ground surface with typical widths of 5-30m. Modelled South Zone mineralisation has a strike of 600m and has been interpreted to a nominal depth of 150m below the ground surface with typical widths of 5-15m.

Criteria	JORC Code explanation	Commentary
		<ul style="list-style-type: none"> Modelled Far West Zone mineralisation has a strike of 1000m and has been interpreted to a nominal depth of 150m below the ground surface with typical widths of 5-15m. Modelled Mason Bay Zone mineralisation has a strike of 1500m and has been interpreted to a nominal depth of 150m below the ground surface with typical widths of 5-30m. Mineralisation has been intersected at surface to a depth of approximately 150m. Along strike mineralisation domains were extended halfway between drill lines or up to approximately 200m beyond a drill line where there was support for stratigraphic continuity from aeromagnetic interpretation. Springdale Block model extents are 2500m east-west, 2500m north-south, -150R. Mason Bay Block model extents are 350m east-west, 550m north-south, -150RL Mineralisation is open at depth in all domains.
Estimation and modelling techniques	<ul style="list-style-type: none"> <i>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</i> <i>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</i> <i>The assumptions made regarding recovery of by-products.</i> <i>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</i> <i>In the case of block model interpolation, the block size in relation to</i> 	<p>Grade estimation using Ordinary Kriging (OK) was completed using Geovia Surpac™ software for TGC and TS.</p> <p>Drill spacing typically ranges from 25m to 50m with some zones to 100-125m. Drill hole samples were flagged with modelled domain codes. Sample data was composited for TGC and TS to 1m using a best fit method. Since all holes were typically sampled on 1m intervals, there were only a very small number of residuals in the diamond core holes that were sampled to geological contacts. • Influences of extreme sample distribution outliers were reduced by top-cutting on a domain basis. Top-cuts were decided by using a combination of methods including grade histograms, log probability plots and statistical tools. Based on this statistical analysis of the data population, no top-cuts were applied. Directional variograms were modelled by domain using traditional variograms. Nugget values are moderate to low (between 15% and 30%) and structure ranges up to 500m. Domains with more limited samples used variography of geologically similar, adjacent domains. Block model was constructed with parent blocks of 6m (E) by 20m (N) by 5m (RL) and sub-blocked to 3.0m (E) by 5.0m (N) by 2.5m (RL). For Lynas Find, it was constructed with parent blocks of 10m (E) by 10m (N) by 5m (RL) and sub-blocked to 5m (E) by 5m (N) by 2.5m (RL).</p>

Criteria	JORC Code explanation	Commentary
	<p><i>the average sample spacing and the search employed.</i></p> <ul style="list-style-type: none"> Any assumptions behind modelling of selective mining units. Any assumptions about correlation between variables. Description of how the geological interpretation was used to control the resource estimates. Discussion of basis for using or not using grade cutting or capping. The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available. 	<p>All estimation was completed to the parent cell size. Discretisation was set to 5 by 5 by 2 for all domains. • Three estimation passes were used. The first pass had a limit of 75m, the second pass 150m and the third pass searching a large distance to fill the blocks within the wire framed zones. Each pass used a maximum of 12 samples, a minimum of 6 samples and maximum per hole of 4 samples. The exceptions to this were domains with less than 20 samples, which used a maximum of 10 samples, a minimum of 4 samples and maximum per hole of 3 samples for the second pass. • As a potential deleterious element, TS has been estimated for this resource. The search ellipses utilised follow the trend of each graphite unit. Search ellipse sizes were based primarily on a combination of the variography and the trends of the wire framed mineralised zones. Hard boundaries were applied between all estimation domains. • Validation of the block model included a volumetric comparison of the resource wireframes to the block model volumes. Validation of the grade estimate included comparison of block model grades to the declustered input composite grades plus swath plot comparison by easting, northing and elevation. Visual comparisons of input composite grades vs. block model grades were also completed.</p>
Moisture	<ul style="list-style-type: none"> Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content. 	<ul style="list-style-type: none"> The Resource is reported on a dry tonnage basis
Cut-off parameters	<ul style="list-style-type: none"> The basis of the adopted cut-off grade(s) or quality parameters applied. 	<ul style="list-style-type: none"> The Mineral Resource has been reported above the mineralised cut-off grade of $\geq 2\%$ TGC.
Mining factors or assumptions	<ul style="list-style-type: none"> Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made. 	<ul style="list-style-type: none"> Based on the orientations, thicknesses and depths to which the graphitic lenses have been modelled and their estimated TGC, the potential mining method is considered to be open pit mining.
Metallurgical factors or assumptions	<ul style="list-style-type: none"> The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made 	<ul style="list-style-type: none"> No metallurgical assumptions have been built into the resource models. The results from metallurgical testwork have been considered for Mineral Resource classification.

Criteria	JORC Code explanation	Commentary
	<p><i>when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.</i></p>	<ul style="list-style-type: none"> Metallurgical testwork has been conducted on both RC and DD core samples and the results using conventional froth flotation have demonstrated the ability to produce high grade graphite concentrates that are predominately fine (<150 micron) and at grades up to 97% TGC. The concentrates produced would be considered a saleable graphite product. Further, additional downstream testwork on graphite concentrates produced from Springdale samples indicate that the graphite concentrates produced would be amenable to produce micronised and spherical graphite products.
Environmental factors or assumptions	<ul style="list-style-type: none"> <i>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</i> 	<ul style="list-style-type: none"> It is assumed that the processing of ore will have a minimal environmental impact. This is based upon other graphite processing operations.
Bulk density	<ul style="list-style-type: none"> <i>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</i> <i>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</i> <i>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</i> 	<ul style="list-style-type: none"> The bulk densities used to report the Mineral Resource is based on: 13 measurements made by the water displacement method on HQ and PQ diamond core carried out by the IMO Metallurgical laboratory in Perth. 34 measurements made by the wax coating method on HQ and PQ diamond core carried out by the Nagrom laboratory in Perth. 321 measurements made by a mixture of plastic wrapped and non-wrapped Archimedes Principal water displacement method on PQ diamond core carried out on site. Bulk densities were then analysed against weathering, depth below surface and mineralisation domains plus against TGC %. The bulk densities assigned to the model used a regression against depth below surface to 70m depth, and then an assign bulk density for anything

Criteria	JORC Code explanation	Commentary
		<p>greater than 70m below surface, as follows:</p> <p>0m to 70 below surface: $BD = (0.0086 \times \text{Depth Below Surface}) + 1.357$</p> <p>> 70 below surface: $BD = 2.0$</p>
Classification	<ul style="list-style-type: none"> <i>The basis for the classification of the Mineral Resources into varying confidence categories.</i> <i>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</i> <i>Whether the result appropriately reflects the Competent Person's view of the deposit.</i> 	<ul style="list-style-type: none"> The Mineral Resource has been classified on the basis of confidence in the geological model, continuity of mineralised zones, drilling density, confidence in the underlying database and the available bulk density information Indicated Mineral Resources are defined nominally on 50m E x 50m to 100m N spaced drilling and Inferred Mineral Resources nominally up to 100m E x 100m to 125m N with consideration always given for the confidence of the continuity of geology and mineralisation. Consideration to the Reasonable Prospects of (Eventual) Economic Extraction (RPEEE) as described by the JORC Code (2012). The cut-off grade (COG) adopted is $\geq 2\%$ TGC. Graphite-rich stratigraphy has been shown to be continuous for significant distances via completed aircore, RC and diamond drilling. Mineralised stratigraphy has been interpreted successfully from aeromagnetic imagery. Drill-spacing in each area is considered adequate for an Indicated and Inferred Resource classification. Excessive extrapolation has not been undertaken with mineralised zones only modelled to 150m below the ground surface where there was drill support depth. Along strike mineralisation domains were extended halfway between drill lines or up to approximately 200m beyond a drill line where there was support for stratigraphic continuity from aeromagnetic interpretation. The Mineral Resource estimate appropriately reflects the view of the Competent Persons
Audits or reviews	<ul style="list-style-type: none"> <i>The results of any audits or reviews of Mineral Resource estimates.</i> 	<ul style="list-style-type: none"> The Mineral Resource has been audited internally as part of the validation process. There has been no external review of the Mineral Resource

Criteria	JORC Code explanation	Commentary
		Estimate.
<i>Discussion of relative accuracy/ confidence</i>	<ul style="list-style-type: none"> • <i>Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</i> • <i>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</i> • <i>These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</i> 	<ul style="list-style-type: none"> • The relative accuracy of the Mineral Resource estimate is reflected in the reporting of an Indicated and Inferred Resource as per the guidelines of the JORC Code (2012 Edition). • The Mineral Resource is a global estimate of tonnes and grade. • Relative tonnages and grade above the nominated cut-off grades for TGC are provided in the body of this report. • No production data is available to reconcile results with.
